ECE332 Lab 3: High Frequency Measurements measurements with the VNA be sure to wear an ESD safety clip and always discharge the conductor (center pin) when connecting cables to the VNA and the Device Under Test (DUT).

Lab 3: High Frequency Measurements

for frequency measurements is usually at a frequency of 1 MHz or higher, with 5 or 10 MHz being common. Frequency signals are usually sine waves, but can also be pulses or square waves. If the frequency signal is an oscillating sine wave, it might look like the one shown in Fig. 17.1. This signal produces one cycle (360° or 2π)

Welcome to my High Frequency Measurements Web page. Below you will find links to interesting technical goodies for download, as well as other interesting websites, information on my seminars, and much more. I will be adding to this site weekly, so check back occasionally.

Internal Mixing First element in a SA™s signal path is the Internal Mixer Translates the input frequency into a range that the SA can use Translated to the Intermediate Frequency stage Placed close to the input signal To improve sensitivity and to avoid increase path loss with increasing frequency Followed by attenuators and optional pre-amplifiers

The "High Frequency Measurements" course covers a broad range of topics from measurement techniques to PCB / PWB and chip package design and troubleshooting issues. This course describes in depth how to measure signal and noise in high speed digital and analogue circuits.

Transformer Frequency Response Measurements It is very useful to make frequency response

measurements on a high-frequency power transformer, using a wide range of frequencies. For a two-winding transformer such as the example above, the most common measurements are impedance measurements from the open-circuited, and short-circuited.
